

TRACKPRO

IOT ENABLED ASSET TRACKING SOLUTION

TrackPro is an IoT-enabled, secure, and efficient asset tracking system designed for fleet management companies to monitor their assets and real-time locations. Using GPS sensors, TrackPro tracks vehicle locations and displays them on a web application linked to the system. Fleet managers can set virtual boundaries or geofences on the map, and the system generates alerts if a vehicle crosses these boundaries.

Key Features

Location Tracking

TrackPro provides two tracking modes: live mode and search mode. Live mode offers real-time location updates of the fleet, while search mode allows users to find the last known location or final destination of the fleet on the map. With both options, fleet managers are able to monitor their assets continuously.

Reports and Analytics

TrackPro provides scheduled reports with real-time fleet data and key performance statistics. These insights on fuel optimization, mileage, safety, speeding, and route mapping help managers make informed decisions to enhance efficiency and reduce costs.

Monitoring Tracker's Health

In addition to vehicle location tracking, TrackPro monitors the health of the trackers. The system alerts fleet managers if a tracker needs a battery replacement or is damaged, ensuring immediate replacement. It also notifies managers if any tracker sends incorrect information, allowing timely error correction.

Multiple Geofences

TrackPro allows fleet managers to create multiple geofences on the map for each vehicle. This feature monitors fleet movement within designated areas and sends notifications to managers via mobile or web application whenever a vehicle exits any of the predefined geofences.
